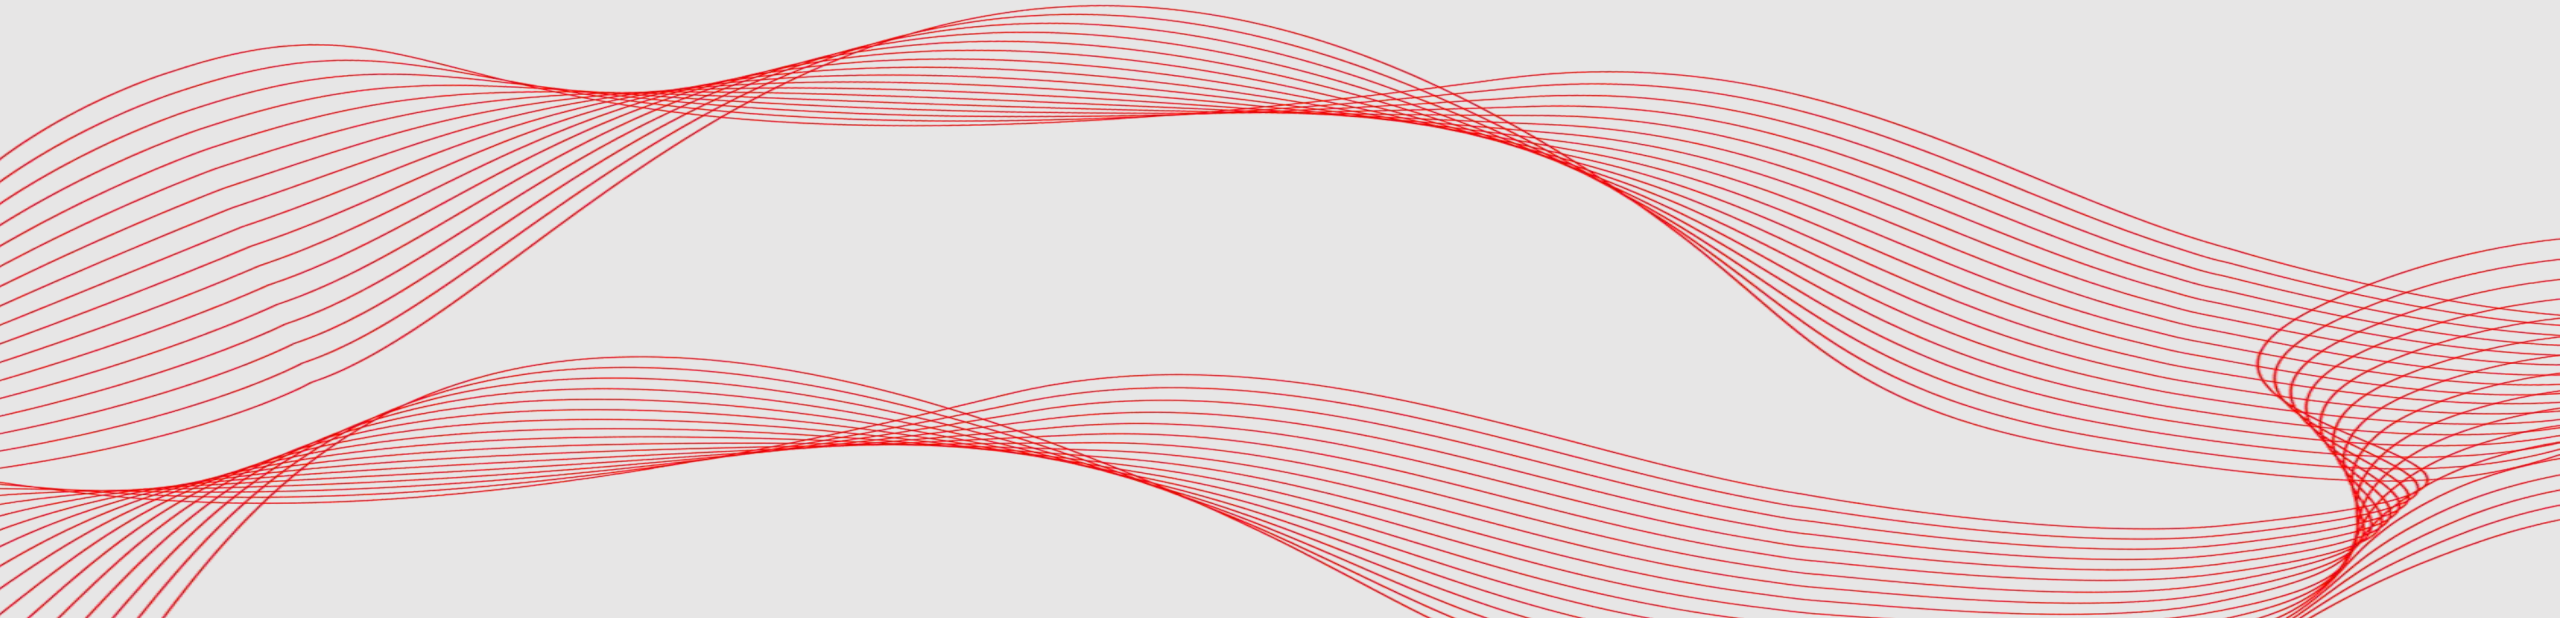
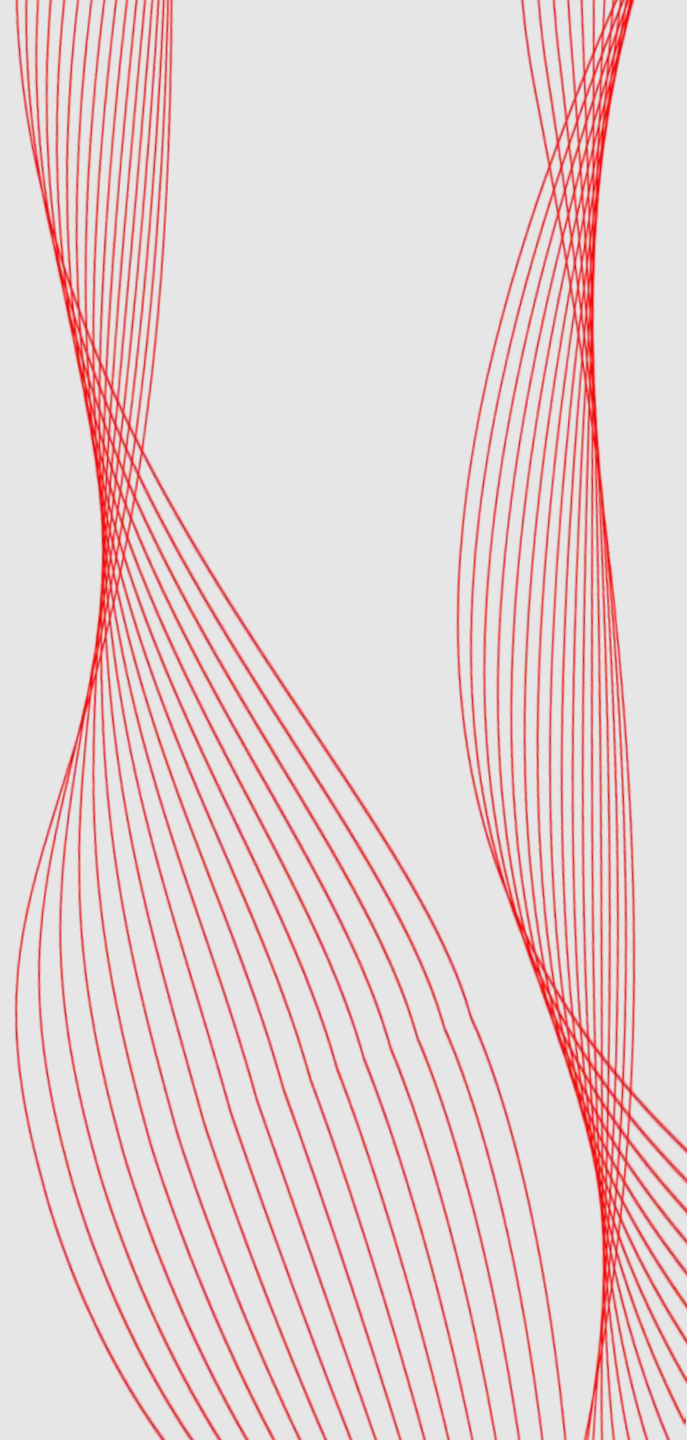
notice

I need more design practice in different applications. That's why I designed all the tasks in PDF format as beautiful slides.



operating system

The operating system that I use is Windows 10. I really like that it is compatible with simple laptop sand cool computers.
Even if you have a cheap motherboard, little ROM and RAM, a simple CPU (central processing unit), you can download and install various programs. By the way, in the lessons of circuit engineering, the teacher said that the system clock in the computer runs on batteries.
Therefore, the computer shows the correct time, even when it has not been turned on for a very long time.



software program

My favorite software program is telegram. This is a very demanding application. Thanks to it, you can store and control many tracks and photos in your favorites, make new notes in messages and communicate with different people. During communication, you can add many attachments up to two gigabytes to messages. There is an opportunity to expand your capabilities. To do this, you need to buy a pro subscription
